Amendment to the Specification

Please amend the specification at page 9, line 19 as follows:

In yet another aspect, the present invention is directed to a <u>non-transitory</u> computer-readable medium operable with an ATM network node. The computer-readable medium carries a sequence of instructions provided for executing service logic which, when executed by a processing entity associated with the ATM network node, causes the ATM network node to perform the following steps. Upon receiving in the ATM network node a signaling message with respect to a call from a party, the signaling message is propagated to a policy server operably associated with the ATM network node. Thereafter, a determination is made in the policy server whether a policy condition associated with a particular policy feature to be invoked is satisfied with respect to the signaling message. If so, an intelligent treatment is effectuated for the call based on the particular policy feature.
